NEW GUINEA GOLD CORPORATION

NGG

PRESS RELEASE

Independent NI 43-101 Report lodged on Sedar for Simuku Property, Papua New Guinea

Vancouver, April 5, 2006 An Independent NI 43-101 Report on the Simuku porphyry copper/molybdenum/gold property in Papua New Guinea has been completed and lodged on Sedar and the Company's web site at www.newguineagold.ca . The report defines drill targets and recommends an interim exploration program (mainly drilling) to evaluate the potential of the property.

More than 20 kilometres of bulldozer/excavator trenching and 12 drill holes have been completed at the Simuku property. Satellite imagery over the Simuku mineralised system shows an apparent large circular feature which could represent a volcanic rim suggesting a caldera or eroded strata-volcano. The Mt Misile target area may represent the core of the larger Simuku porphyry (2km diameter) with a potassic core and halo of magnetic destruction. Alternatively the Simuku system may be a product of multiple intrusives.

Copper, molybdenum and gold mineralisation are discontinuously present over an area of **at least 5km by 2.2km.**

At Simuku many significant copper, molybdenum and gold trench and drill hole intersections have been defined and these are shown on the accompanying plans and tables. The copper intersections need to be evaluated with caution as drilling evidence suggests substantial depletion of copper at surface in some areas. Copper has been leached and taken into solution, reducing the original or actual copper values at surface. Drilling suggests that trench intersections of 0.1% copper could in certain areas represent much higher copper values in the subsurface.

The best drill hole intersections from historical drilling were:

- 41m @ 0.64% copper
- 63m @ 0.52% copper
- 36m @ 0.70% copper
- 150m@ 0.35% copper

Some of the better trench results from the current and historic trenching were:

- 73m @ 0.17% molybdenum
- 6 m @ 0.34% molybdenum
- 70m @ 0.4% copper
- 14m @ 1.03% copper
- 27m @ 0.76% copper
- 15m @ 0.58g/t gold
- 24m @ 0.5g/t gold

There were 203 separate trench intersections of copper, gold and molybdenum mineralisation above cut off grades of 1000ppm, 0.05g/t gold and 100ppm molybdenum respectively. These are listed on the accompanying tables. Most of the intervening intervals between the listed intersections contained anomalous copper in the range of 0.05% to 0.1% copper. **Simuku is prospective for the following types of mineral deposits:**

(i) *Porphyry-style copper-gold-(molybdenum) deposits* associated with quartz feldspar porphyry and quartz microdiorite to (?) monzonite intrusions. Four targets have been defined for this style of mineralization, Nayam, West Tobarum, Misili and Magipmo.

(ii) *High grade/low tonnage molybdenum deposits* in linear, fissure-controlled breccia zones. The Boss Mountain molybdenum deposit in B.C., Canada is an example of this type of deposit. The main target is the Misili Molybdenum Prospect.

(iii) *Stockwork porphyry molybdenum deposits* associated with felsic intrusives. Examples include Alice Arm, Berg and Endako in Canada. An interpreted intrusive body at Misili, believed to be genetically linked to the fissure breccia molybdenum prospects, may be prospective for stockwork molybdenum mineralization.

(iv) There is also some potential for the discovery of skarn-style base metal/gold deposits peripheral to the main Cu-Mo system.

The Simuku system is a major copper, gold and molybdenum mineralised area. NGG estimates that expenditures of approximately $10 million will be required for the next staged drill programs and other exploration. At present such expenditures are beyond the financial capability of the Company and alternative methods of taking the property forward are being assessed.

NGG is developing a gold mine at the Sinivit Property and expects annualised production of 35,000 ozs gold from third quarter 2006. In addition NGG has a comprehensive drilling program in place for 2006 to define gold resources at other key gold properties, Normanby (Imwauna), Mt Penck, and Sehulea (Weioko). See Press Release dated 22nd February 2006 for an update on NGG and other details on gold production.

For further information contact Forbes West toll free at 888 655 5532, email forbes@sherbournegroup.ca or Judith O'Quinn at 604 662 3598, email ngg@telus.net

The technical data in this release was prepared by or under the supervision of Robert D. McNeil, CEO of New Guinea Gold Corporation. Mr McNeil has an MSc in Geology, 44 years mining industry experience, is a Fellow of the Australian Institute of Mining and Metallurgy, and meets the requirements of NI 43-101 for a qualified person.

ON BEHALF OF THE BOARD

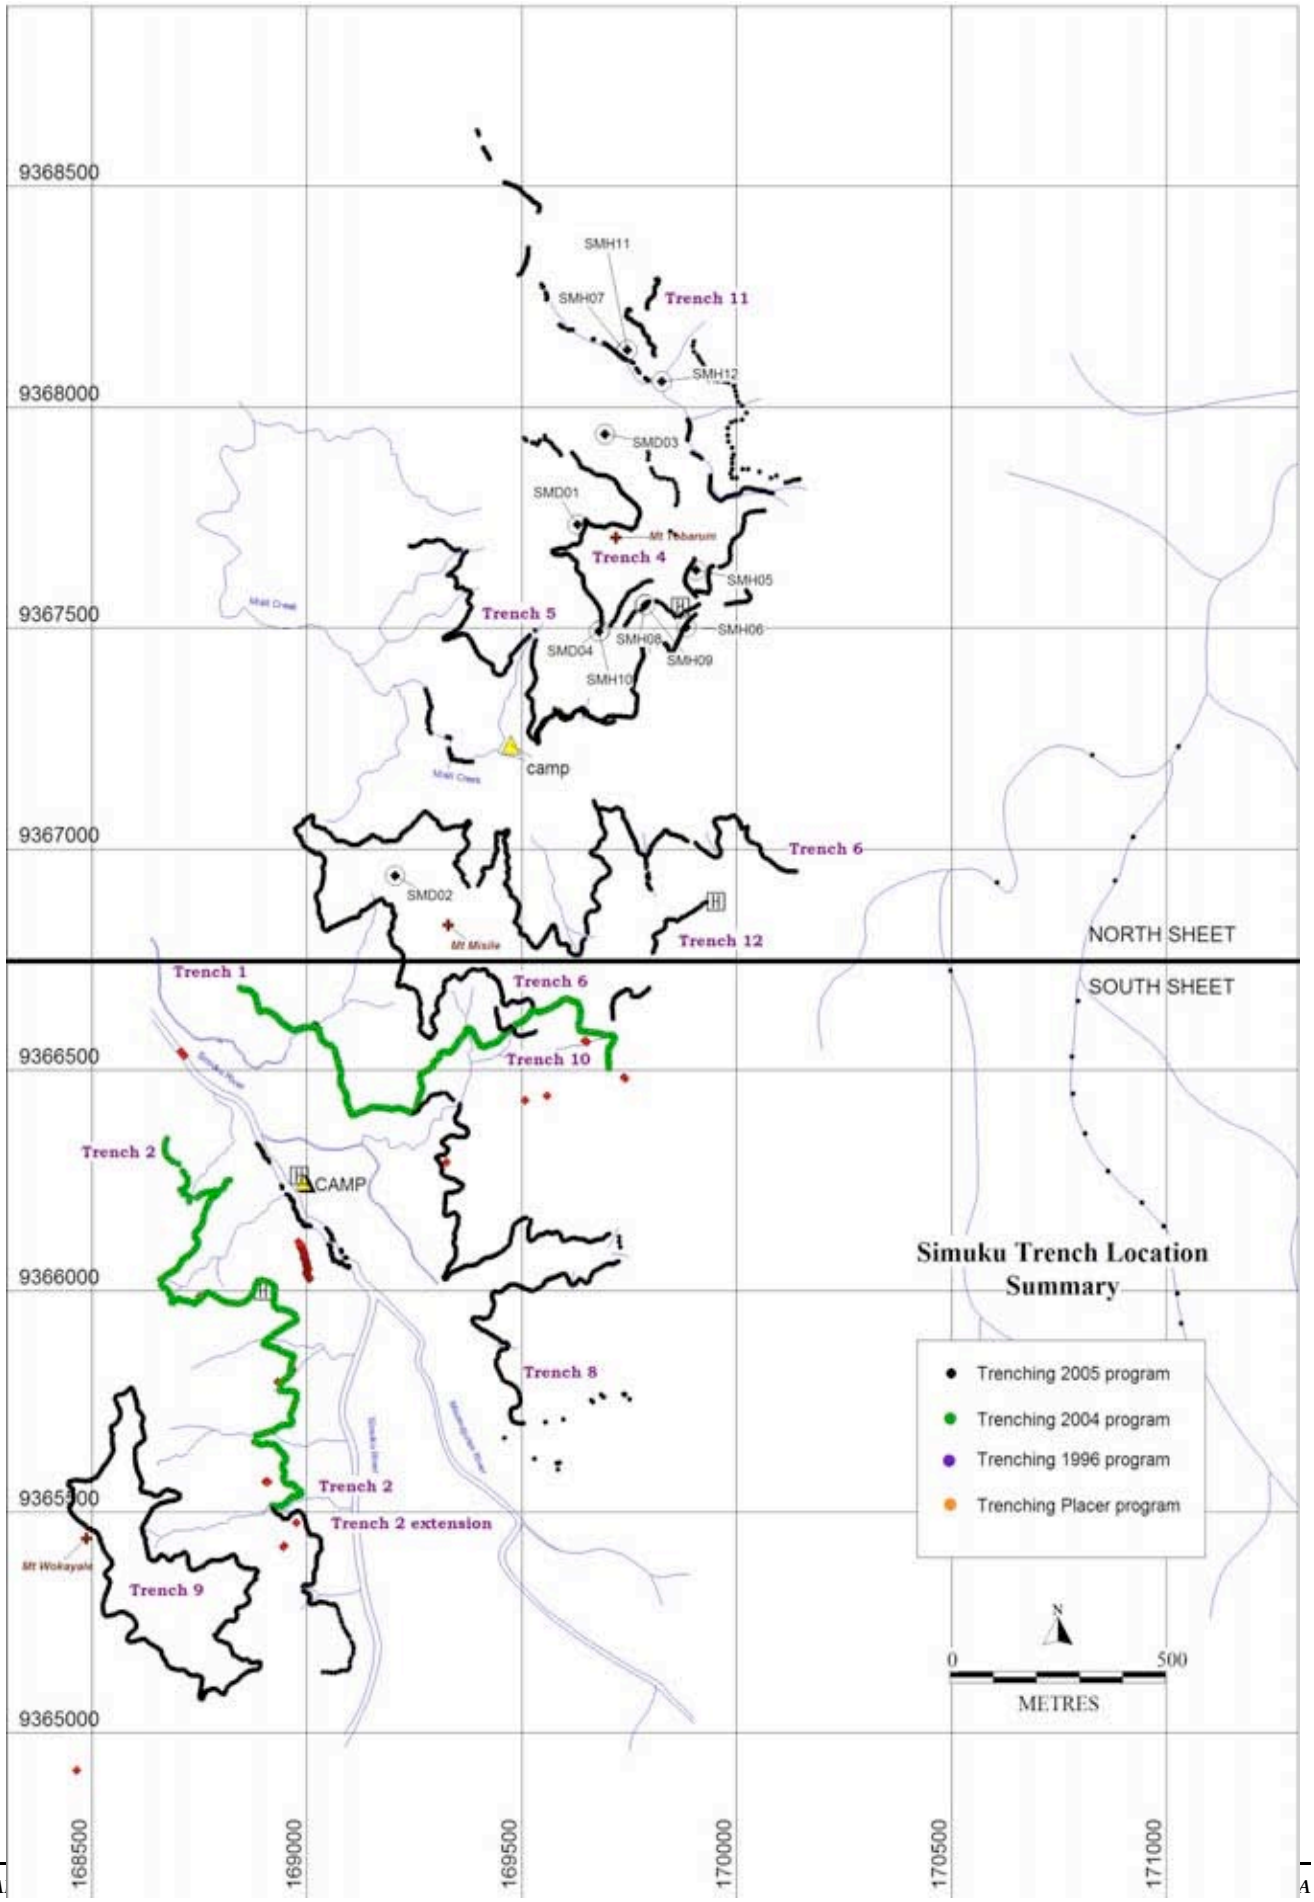

"R.D.McNeil"
CHAIRMAN & CEO

The TSX Venture Exchange has not reviewed and does not accept the responsibility of the adequacy of this release. The statements made in this News Release may contain certain forward-looking statements. Actual events or results may differ from the Company's expectations. Certain risk factors may also affect the actual results achieved by the Company.
